

Name _____

Path of the Sun

Date _____

Position of Sunrise /Sunset

Date	Sunrise	Sunset
Equinox		
12/21		
6/21		

The altitude of the noon sun depends on the _____

Each Season the angle of the noon sun changes by _____

Steps to Determine the Altitude of the Noon Sun.

Location of the Vertical Ray

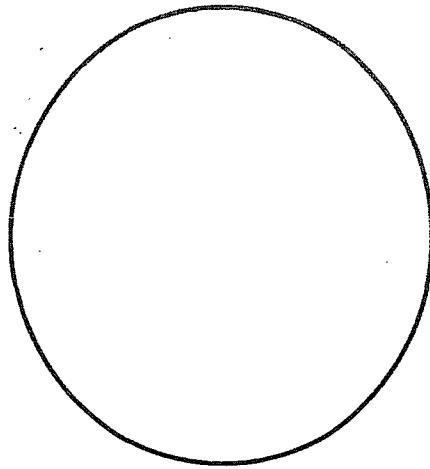

On the Equinox, the Vertical Ray of the sun hits the _____ so the angle of the sun is _____ at the _____

Step 1 Find the latitude of the location and subtract the latitude from 90° .

This is the Angle of the Noon sun for the equinox.

Step 2 For the Summer Solstice angle, add 23.5° to the Equinox angle.

Step 3 For the Winter Solstice angle, subtract 23.5° from the equinox angle.

The position of a shadow can be used to measure the position of the Sun.

The direction of a shadow depends on the direction of the sun.

The shadow is always opposite the direction of the sun.

If you know the azimuth of the sun you add 180° to find the shadow direction

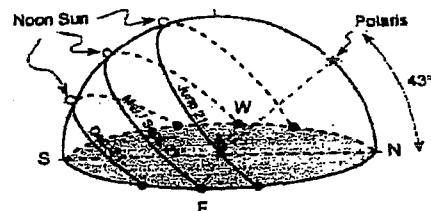

The Length of the shadow depends on the angle of the sun.

When the sun is at a higher angle the shadows are shorter.

When the sun is at a lower angle the shadows are longer.

From Sunrise to Solar noon the shadows get shorter.

From Solar Noon to Sunset the shadows get longer.

Shadow Length changes with the seasons.

During the Summer Solstice, the noon sun is at the highest angle so you have the shortest shadow.

During the Winter Solstice, the noon sun is at the lowest angle so you have the longest shadow.

Noon Sun

In the New York State, the Noon Sun is over the Southern Horizon.

The Noon Shadow always points NORTH when you are in New York State.
